How to Compile & Run

Windows

If [CodeBlocks](#) is installed, open the project solution and press "Build and run" (or press the **F9** key)

Note

If an error is returned on build and run, close CodeBlocks and reopen. Sometimes the IDE doesn't behave properly with the program but if you use the executable in `/bin/debug/` it will run fine from a command line.

MacOS / Linux

```
$ g++ -Wall main.cpp -o 377_project
$ ./377_project
```
